### **Abstract**

Now-a-days, in such a competitive environment, the level of customer expectations is increasing. The sustenance of an industry basically depends on the processes and applications. Many industries initially more focus on the ways to increase production volume yet quality all that matters; it is one of the most important criteria in ever increasing customer expectations. For keeping the cost low with quality is a great challenge for any kind of manufacturing or service industry. Lean manufacturing system (LMS) and Quality management system (QMS) i.e. ISO 9000 make the business more effective. This paper presents the ways to improve quality with having standard quality system and to reduce wastes through lean. In this paper there is a proactive integrated model.
